- Miner can add multiple transactions onto his new block.
- Must validate each transaction in the way I just described.
- Miner finds the correct nonce, and announces his block with information about all the transactions that he added to it.
- Other miners first verify nonce, then verify that each transaction described in the proposed new block are legitimate.
- If all is correct, other miners vote OK and add this new block to their own blockchains.
- A new block that contains BLT's transaction has been added to the blockchain!
