Example

- You want to pay for something that costs 0.3 BTC

- Valid inputs would be:

  - 0.2 BTC from Bob + 0.1 BTC from Yuwa

  - 0.5 BTC from Mom

- Invalid inputs would be:

  - 0.3 BTC from Mom

  - 0.1 BTC from Bob + 0.1 BTC from Yuwa + 0.1 BTC from Mom

Example Continued

- Let's say your input was 0.5 BTC from Mom

- That's clearly more than enough for the 0.3 BTC item you wanted to purchase

- So your output would be something like this:

  - 0.3 BTC to store

  - 0.2 BTC to yourself
